**Chemically modified surfaces in science and industry**

Small angle neutron scattering has been used to characterize the structure of linear hydrocarbon chains chemically grafted to the internal pore surfaces of microporous silica particles.

**Characterization of Chemically Modified Pore Surfaces by**

The investigations described in this thesis are concerned with the chemical modification of various non-porous and porous silica support materials. Furthermore, the resistance towards deterioration of various modified silicas under conditions normal for daily chromatography practice will be studied in detail.

**A fundamental study of chemically modified silica surfaces**

or stably surface modified with non-biological reagents or electrical discharge. Glass surfaces were chemically modified in two ways: using a proprietary procedure and reagents or as described by Kleinfeld, et al. (1988). All substrates were assembled into Thermo Scientific Nunc Lab-Tek and Lab-Tek II Chamber Slide products.

energies of these chemically modified surfaces were estimated by measuring the deformations that resulted on contacting small semispherical lenses and flat sheets of the polymer under controlled loads.

**Correlation between Adhesion Hysteresis and Phase State of**

We have developed surface chemical modification processes which when applied to a variety of surfaces renders the surfaces resistant to particulate contamination. Chemically modified surfaces are shown to shed particles at a dramatically higher level as compared to native surfaces.

**Reducing particle adhesion by material surface engineering**

The optical properties of chemically modified surfaces are reported. The surface modification process is robust and stable to aggressive cleaning. The particle shedding properties of chemically modified surfaces are retained after simulated extraterrestrial vacuum ultra-violet light exposure and temperature excursions to 140°C.
