Pyrolysis can also be used to treat plastic waste. The main advantage is the reduction in volume of the waste. In principle, pyrolysis will regenerate the monomers (precursors) to the polymers that are treated, but in practice the process is neither a clean nor an economically competitive source of monomers.

Pyrolysis oil, sometimes also known as biocrude or bio-oil, is a synthetic fuel under investigation as substitute for petroleum. It is obtained by heating dried biomass without oxygen in a reactor at a temperature of about 500 °C with subsequent cooling. Pyrolytic oil (or bio-oil) is a kind of tar and normally contains levels of oxygen too high to be considered a hydrocarbon.

The fundamentals of pyrolysis, its latest developments, the different conditions of the process and its residues are of great importance in evaluating the applicability of the pyrolysis process within the waste management sector and in waste treatment.

### **Potential of pyrolysis processes in the waste management**

Pyrolysis has been examined as an attractive alternative to incineration for municipal solid waste (MSW) disposal that allows energy and resource recovery; however, it has seldom been applied independently with the output of pyrolysis products as end products.

The technology can be applied in households, institutions (such as schools) and industries where it is used for boiler heating. Biomass gasification household stoves work by a high temperature conversion of biomass in a restricted oxygen environment to a mixture of nitrogen, carbon monoxide, hydrogen, and methane.

02 Market and Industry Trends. Relatively inflexible baseload generators, such as coal and nuclear power plants, have always been complemented by FLEXIBLE GENERATION to adapt the electricity supply to time-variable demand. Hydropower and other dispatchable renewables such as bio-power, and concentrating solar thermal power (CSP) with thermal storage offer flexible renewable energy generation ...
